Description

Open gvSIG
New table
Add table rrline.dbf (<http://downloads.gvsig.org/download/geodata/tables/DBF/rrline.dbf.zip>)
Add table rrline_filipinas.dbf (http://downloads.gvsig.org/download/geodata/tables/DBF/rrline_filipinas.dbf.zip)
Add table rrline_japon.dbf (http://downloads.gvsig.org/download/geodata/tables/DBF/rrline_japon.dbf.zip)
Table, create join
Choose a data store as "rrline.dbf" and click Next
Choose the second data store as "rrline_filifinas.dbf" and click Next
Choose as key of first table "rrlntype", the key of second table "rrlntype", type of prefix for the first table: 1, type of prefix for the second table: 2 and "userId" as the attribute to join. Next and finish.
Now we see the userId added to the table rrline.dbf
Table, create join
Choose a data store as "rrline.dbf" and click Next
Choose the second data store as "rrline_japon.dbf" and click Next
Choose as key of first table "rrlntype", the key of second table "rrlntype" type of prefix for the first table: 12, type of prefix for the second table: 3 and "userId" as the attribute to join. Next and finish.
Now we see the second "userId" added to the table rrline.dbf
Save the project
Close gvSIG
Open gvSIG
Load last gvSIG project
A warning message appears: "Can't perform action 'application-project-open'."

- Target version deleted (2.0.0-final)

#3 - 01/03/2014 08:55 AM - Juan Lucas Domínguez

El problema es que al despersistir la JoinTransform se necesita acceso al store con las transformaciones anteriores aplicadas, lo cual no ocurre y se produce un error con el nombre de los campos disponibles. En este momento no veo modo de arreglarlo sin correr el riesgo de "daños colaterales".

El problema empieza en esta línea (método initialize de JoinTransform):

```
EditableFeatureType editableFeatureType = this.getFeatureStore().getDefaultFeatureType().getEditable();
```

Ahí debería tener los campos de un store ya transformado, pero al despersistir, eso no es así.
