Add-on name: Unknown	

Description

If I rename a layer in the ToC with an empty string and save then the gvSIG project, then the project becomes not usable. In detail, it can't be opened again because the number of layers is e.g. N, however only N-1 layers are read from the gvp file and so an XML exception occurs. In order to avoid to rename a layer with an empty string, the user should be warned with a proper message.

Cheers,
Antonio
