Description

When we edit a layer in Windows it sometimes doesn't allow us to finish editing mode. The only mode for saving changes is to export to a new layer.

It happens in these situations:

- When the layer is loaded in the same view or in another one (it should finish editing, and when we change zoom or reload the layer in the other view, the changes should be done)
- When we create new layer, and we write the name of the layer in the output file text box, instead of selecting the folder with the "..." button.

But sometimes it has happened in other different situations.

History

#1 - 11/12/2015 09:01 PM - Joaquín del Cerro Murciano

- Status changed from New to In progress

#2 - 11/16/2015 12:22 PM - Mario Carrera

- File gvSIG-saving-shp.log added

I attach a new gvSIG.log file.

It has happened in Windows, but it's not any of the previous commented situations.

#3 - 11/26/2015 04:38 PM - Daniel Martinez

- Related to gvSIG bugs #3892: When a shp file is edited, and some field has more than 10 characters it's not saved added

#4 - 11/26/2015 04:44 PM - Daniel Martinez

- % Done changed from 0 to 100

- Target version changed from 98 to 2.3.0-2409 (rev. org.gvsig.desktop-2.0.115)

- Status changed from In progress to Fixed

Now when a folder is not selected, the layer is saved in user home folder.

When the same shp file (or its dbf component file) is open twice or more, it can be saved, although the not saved files must be refreshed manually. A new table-refresh menu entry has been added to allow table refreshing.
