Description

SLD is the de factor OGC standard for styling of vector and raster files.

Right now there is support for SLD in the sense of vector styling.

To use SLD also in gvSIG as standard style exchange format, two things would be very important:

- support for the export of labelling
- support for raster legends

History

#1 - 12/04/2015 12:01 PM - Andrea Antonello

- File *natural_earth_sld_problem.zip* added

I attach an example shp+SLD created with gvSIG for the natural earth shapefile of countries.

In that case, when the legend is loaded from the SLD, the legend labels do not appear in the legend (in the layer view), even if in the SLD they are available.

#3 - 02/23/2018 01:58 PM - Mario Fevre

at saving SLD (build 2848) fill opacity is always 1. transparency is lost.
