Has patch: No	

Description

Steps to reproduce:

1. Configure a view with 3 layers
2. Configure a layout with a view and two legends. In one of the legend uncheck one of the layers, to not show it
3. Change the name of the "unchecked" layer in the view.

The legend where the layer should not be shown is refreshed and the layer becomes visible in it.

To get it invisible again, you must edit the properties and uncheck the layers two times. It doesn't work at the first attempt.
